

# Funding Method Options

#### FINAL PROPOSAL

By Ryan Frost Senior Research & Policy Manager 360-586-2325

ryan.frost@leoff.wa.gov

### **ISSUE STATEMENT**

There are a variety of funding methods used to estimate the cost of future benefits, therefore it is up to the Board to decide which method aligns best with their funding goals.

### **OVERVIEW**

The aggregate cost method is the statutory funding method for all the plans, including LEOFF 2. However, the Board has used a temporary funding method for much of its history. When the Office of the State Actuary (OSA) presents to the Board, they will point to aggregate as being the long-term method or the statutory method for funding the plan.

The Board was created right after a market crash, at a time when rates were out of bounds with what the normal cost of the plan was. Therefore, the Board adopted a stair step annual rate increase to tie them into the normal cost of the plan. Then, in 2008, right before another market crash, the Board adopted a temporary funding method, setting rates at 100% of the normal cost.

### **BACKGROUND**

#### **Funding Policy**

A funding policy is very important to the success of a pension plan, because these policies help address the plan's affordability, the risk of the plan, rate stability, and rate adequacy. While the funding method is the underlying rate calculation, any funding policies the Board adopts is layered on top of that. LEOFF Plan 2 has stated the following as goals in the funding policy:

- Stable short-term contribution rates
- Full funding on an ongoing basis
- Smoothing investment returns
- Asset value corridor
- Minimum contribution rates
- Multi-year rate plans

### **Funding Method**

The choice of a funding method is a core issue for a pension plan because the funding method determines the way the cost of the plan will be financed over time in much the same way that the choice of a style of mortgage determines the way in which the cost of a house is financed over time. All standard funding methods will accomplish the same goal of completely funding the cost of the plan just like either a fixed-rate mortgage or an adjustable-rate mortgage can be used to pay for a house.

This report will examine two of the standard pension funding methods used by LEOFF Plan 2 since its inception, the aggregate funding method and the entry age normal cost method (EANC), as well as examine the variation of those funding methods that the LEOFF 2 Board has chosen to use when setting contribution rates.

### **FUNDING GOALS**

#### **Stable Contribution Rates**

Stable contribution rates result in more predictable budget obligations for plan members, local government employers and the State which helps them prepare to meet their future funding obligations. The LEOFF Plan 2 Retirement Board has adopted contribution rate stability as one of the key elements of the Board's strategic plan for LEOFF Plan 2.

There are a number of policies which have been adopted by the LEOFF Plan 2 Retirement Board in order to moderate short-term swings in contribution rates.

- 1. Smoothing investment gains or losses over a period of time
- 2. Asset value corridor
- 3. Minimum contribution rates
- 4. Multi-year rate plans

### **Full Funding on an Ongoing Basis**

In addition to short-term contribution rate stability, the Legislature adopted a goal of long-term contribution rate stability when LEOFF Plan 2 was first created. The term used to describe this goal in statute is "intergenerational equity" or the concept that each generation of members, employers and taxpayers pays for the benefits that they receive. Costs for current member benefits are not passed on to future generations.

There are two common causes of long-term contribution rate volatility; underfunding and benefit improvements. The Aggregate Funding Method used in LEOFF Plan 2 supports the goal of long-term contribution rate stability because this funding method eliminates the risk of plan underfunding (or overfunding). Benefit improvements also increase the cost of the plan. Benefit improvements that apply to retired members or to past service credit for current members may

raise a concern that the current generation of members is paying for past benefits so this issue has been considered carefully by the LEOFF Plan 2 Board any time that the Board has recommended a benefit improvement to the Legislature.

### **Smoothing Investment Returns**

The current assumption is that assets invested in the LEOFF Plan 2 Retirement Fund will earn 7.4% per year over the long-term. However, on a year-by-year basis, the investment return is almost certain to be higher or lower than 7.4% which results in a "gain" or "loss" when compared to the 7.4% earnings expectation. Public pension funds commonly "smooth" or phase in the recognition of these annual investment gains or losses over a period of time in order to soften the effect of short-term financial market volatility on contribution rates because averaging investment returns over a period of time will result in greater contribution rate stability over that same period of time. The current smoothing method for LEOFF Plan 2 recognizes investment gains or losses over a period of as much as eight years.

#### **Asset Value Corridor**

Smoothing investment returns results in a variance between the true market value of the assets in a retirement fund and the assumed value which is used to determine the contribution rates for the plan. An asset value corridor ensures that the variance stays within a set amount which increases contribution rate stability during periods of unusual investment gains or losses. LEOFF Plan 2 uses a 30% market value corridor which means that the actual market value of assets may not drop below 70% of the assumed value of assets or rise above 130% of the assumed value of assets. The historical market value vs actuarial value of assets can be found in Appendix B.

#### **Minimum Contribution Rates**

Minimum contribution rates are often referred to as a "rate floor" and are used to ensure that short-term contribution rates do not drop below the expected long-term cost of the plan by more than a set amount. A rate floor is particularly useful for stabilizing contribution rates during periods of better than expected investment returns and when there are short-term variances in plan funding levels resulting from changes to assumptions or the plan funding method. The LEOFF Plan 2 Retirement Board adopted 90% of the expected long term cost of the plan as the contribution rate floor for LEOFF Plan 2.

#### Multi-year Rate Plans

Adopting a multi-year contribution rate plan is another useful method for improving the short-term predictability of contribution rates. The contribution rate may vary during the period of the plan or remain level depending on plan funding needs. The LEOFF Plan 2 Retirement Board adopted a four-year schedule for contribution rates in 2008 which set rates for the entire period exactly equal to the expected long-term cost of the plan.

### **FUNDING METHOD**

#### The Aggregate Funding Method

The aggregate funding method has only one component, the normal cost. The normal cost takes the cost of all future benefits and spreads that over the future payroll of all current members.

When LEOFF Plan 2 was created in 1977, the aggregate method was chosen by the Legislature as the plan's funding method because it was particularly well suited to accomplish two pension funding policy goals which were considered important at that time; long-term stability in contribution rates and full funding of the plan on an ongoing basis. As part of its Strategic Plan in 2004, the Board adopted the policy goals of contribution rate stability and full funding of LEOFF Plan 2 and reaffirmed use of the aggregate funding method to accomplish these goals.

The aggregate funding method promotes long-term stability in contribution rates because it is designed to fund the cost of the plan as a level percentage of pay over a member's working career. The contribution rates paid by the plan members and their employers would theoretically remain unchanged for the member's entire career if the plan's long-term economic assumptions and assumptions regarding member behavior were 100% accurate.

To the extent that those assumptions prove inaccurate, any difference between what is expected and what is experienced, such as lower than expected investment returns, is reflected in the plan's cost each time the plan is reviewed and a new long-term rate is calculated.

Therefore, short term contribution rates can and do experience ample volatility. A plan using the aggregate funding method will always be 100% funded if the required contributions are paid; it will never have a surplus or an unfunded liability.

### The Entry Age Normal Cost Method

The EANC method has two components; the normal cost, and an unfunded actuarial accrued liability (UAAL). The UAAL refers to the difference between the actuarial values of assets owned by the plan and the total benefits due to be paid. Unfunded liabilities are created when the actual plan investment returns are less or more than the assumed returns, and when other plan assumptions are realized, resulting in actual costs exceeding or below predicted costs.

Both of these components are necessary in this funding method to achieve the goal of fully funding the benefits when they are due. The normal cost is more stable under the EANC because it doesn't include any of the experience that differs from assumptions, that is what the UAAL component is for. The normal cost only changes when plan assumptions are changed<sup>1</sup>.

\_

<sup>&</sup>lt;sup>1</sup> For example, lowering the investment return assumption from 7.5% to 7.4%

### **LEOFF 2 Board Funding Method**

The Board has two policies in place when it comes to the funding method<sup>2</sup>:

Short term: 100% EANC

Long term: Aggregate, with rate floor of 90% EANC

As stated previously, under the EANC method, there are two components: the normal cost, and the UAAL (surplus or deficit) which is amortized over time. Under the Board's temporary funding policy, the amortization of the unfunded liability is eliminated. Instead, rates are tied to the normal cost and the UAAL will fluctuate up and down (within the corridor) depending on investment performance. This method provides more stable rates than the EANC. One downside to not using the full EANC method is that the plan can become too overfunded, or too underfunded, because the UAAL portion is being ignored.

-

<sup>&</sup>lt;sup>2</sup> An important detail in the discussion around changing funding methods/policies is that changing them will not affect current contribution rates

## **POLICY OPTIONS**

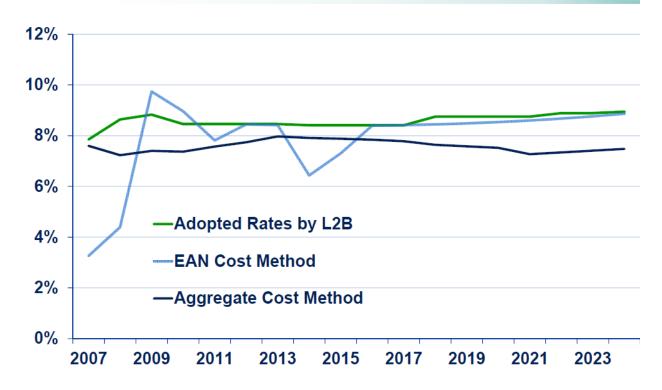

- 1. Continue to use 2 funding methods
  - Short term: 100% EANC
  - Long term: Aggregate with 90% EANC floor
- 2. Change long term method to 100% EANC
  - How to manage UAAL?
    - i. Amortization
    - ii. Funding ratio corridor

## **APPENDIX B**

### **Actuarial Value Of Assets Less Volatile Than Market Value**

# **Funding Method Options**

Final Proposal July 25, 2018

## **Issue Statement**

There are a variety of funding methods used to estimate the cost of future benefits, therefore it is up to the Board to decide which method aligns best with their funding goals.

# **Background**

- Aggregate
  - Statutory funding method for all plans, including LEOFF 2
- Board has used a temporary funding method for much of its history
- When OSA presents to the Board, they will point to aggregate as being the long-term method, or the statutory method, for funding the plan
- Board was created right after a market crash at a time when rates were out of bounds with what the long term expected cost of the plan was
  - The Board adopted a stair step annual increase to rates to tie them in with the long term expected cost of the plan
  - In 2008, right before the market crash, the Board adopted a temporary funding method to set rates at 100% of the long term expected cost of the plan

# **Funding Policy Overview**

- Stable contribution rates
- Full funding on an ongoing basis
- Smoothing investment returns
- Asset value corridor
- Minimum contribution rates
- Multi-year rate plans

# **Funding Method Overview**

- All methods accomplish the same goal of completely funding the cost of the plan
  - Fixed rate vs. adjustable rate mortgage
- Aggregate method
- Entry age normal cost method
- LEOFF 2 Board funding method

# **Stable Contribution Rates**

- Predictable budgets for stakeholders
- Policies to moderate short term swings:
  - Investment smoothing
  - Asset value corridor
  - Minimum contribution rates
  - Multi year rate plans

# **Smoothing Investment Returns**

- 7.4% return assumption
- Earnings will almost always be higher or lower than 7.4%
- Returns smoothed over a period of up to 8 years

## **Asset Value Corridor**

- Smoothing results in a variance between market value and actuarial value of assets
- AVC ensures that the variance stays within a set amount to increase rate stability
- LEOFF 2 uses a 30% corridor
  - The actuarial value of assets can't fall below 70% or above 130% of the market value

## **Minimum Contribution Rates**

- Often referred to as a "rate floor"
- Used to ensure that short-term rates do not drop below the expected long term cost of the plan by more than a set amount
- LEOFF 2 has historically adopted a 90% or 100% rate floor

# **Multi-year Rate Plans**

- Another method to improve predictability of rates
- LEOFF 2 uses a 4-year schedule for adopting rates

# **Aggregate Funding Method**

- Has only one component, the normal cost
- Normal cost takes cost of all future benefits and spreads that over current members
- Funding method in statute since plan inception in 1977
  - Long term rate stability
  - Fully funds plan
- Any difference between experience and assumptions leads to rate volatility
  - Aggregate wants the plan to always be 100% funded, ASAP
  - No UAAL, plan will always be 100% funded if required contributions are made

# **Entry Age Normal Cost Method**

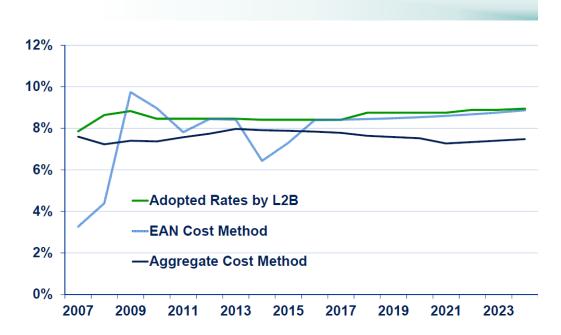

- Two components
  - Normal cost
  - UAAL
- UAAL may be positive or negative
  - Amortized over time
- Normal cost is more stable under EANC
- Normal cost only changes when plan assumptions change

# **LEOFF 2 Board Funding Method**

- Two policies for funding method:
  - Long term: Aggregate, rate floor of 90% EANC
  - Short term: 100% EANC
- Board's funding policy:
  - Variation of EANC
  - Amortization of UAAL is eliminated
  - Rates tied to normal cost, UAAL fluctuates based on investment returns
  - Provides the most stable rates out of the 3 methods

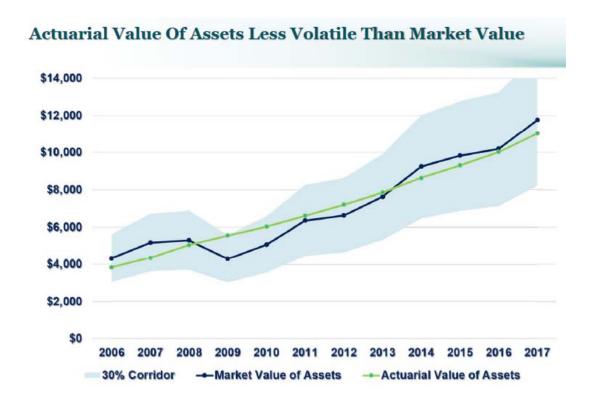

# **Estimated Rates**

### **Estimated LEOFF 2 Employee Contribution Rate Path**

O:\LEOFF 2 Board\2017\10-18-17\Actuarial.Funding.Discussion.pptx

# Market Value vs. Actuarial Value

# **Policy Options**

- 1. Continue to use 2 funding methods
  - Short term: 100% EANC
  - Long term: Aggregate with 90% EANC floor
- 2. Change long term method to 100% EANC
  - How to manage UAAL?
    - Amortization
    - Funding ratio corridor

# Thank You
